Contour lines are used to denote elevation above sea level. For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall appearance of the contour lines. With this information, a general sense of the lay of the land can be ascertained. Gentle slopes are represented by closely spaced contour lines, while steep slopes are represented by closely spaced contour lines. Contour lines that cross streams flowing through valleys of noticeable relief will form a V-shaped deflection. A horizontal accuracy of approximately 3 feet on the ground for airborne survey; data was collected unevenly in some areas. This resulted in data gaps that affect the overall appearance of the contour lines. With this information, a general sense of the lay of the land can be ascertained. Gentle slopes are represented by closely spaced contour lines, while steep slopes are represented by closely spaced contour lines. Contour lines that cross streams flowing through valleys of noticeable relief will form a V-shaped deflection. A horizontal accuracy of approximately 3 feet on the ground.
