Con current with
Angle of the land can be ascertained. Gentle slopes are represented by closely spaced contour lines. Steep slopes are represented by widely spaced contour lines. Contour lines that cross streams flowing through cliffs of noticeable relief will form a V-shaped deflection.

LiDAR data for the year 2000. This information is only provided for general planning and informational purposes. It is not intended for exact determinations of elevation where a survey is normally required, or for detailed engineering, building, or design purposes. The Connecticut LiDAR dataset for 2000 captured ground elevation every 24 feet at an absolute accuracy of approximately 3 feet on the ground.

for unknown reason, data was collected remotely in some areas. This resulted in data gaps that affect the overall quality of the information shown on the map. These gaps are noted in these contour lines. With this information, a general sense of the lay of the land can be determined. Mapped areas are characterized by widely spaced contour lines, while steep slopes are represented by closely spaced contour lines. Contour lines that cross streams flowing through cliffs of noticeable relief will form a V-shaped deflection.

CONTOUR DATA - Derived from a statewide 10- second digital elevation model (DEM) surface based on the Connecticut 2008 LiDAR ground elevation data. The University of Connecticut Center for Geospatial Information and Services and the Community Emergency Response Team (CERT) for the DEM and edited it to fill in data gaps with information from contour lines on a 1998 1:24,000 scale topographic map.

MAP and Vector 2010 - Visit the CT 2010 website for this map and a variety of other GIS formats. Visit the CT DEM website to download the base map digital spatial data shown on this map.
