Contour lines are used to denote elevation above sea level. Contour lines are derived from the Connecticut 2000 LiDAR ground elevation data. For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall accuracy and appropriateness of derived data products such as these contour lines. With this information, a general understanding of elevation can be gained. For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall accuracy and appropriateness of derived data products such as these contour lines. DATA SOURCES

CONTOUR DATA - Derived from a statewide 10-foot Digital Elevation Model (DEM) surface based on the Connecticut 2000 LiDAR ground elevation data. The University of Connecticut, Center for Land Use Education and Research (CLEAR) created this data. The DEM and edited it to fill in data gaps with horizontal accuracy of approximately 3 feet on the ground.

BASE MAP DATA - All data is based on 1:24,000 scale topographic maps and other geographic sources shown and/or identified on this map, including roads, railroads, land uses, airports, and hydrography. Base map data is either current or complete.

STREET DATA - Based on TeleAtlas copyrighted data.

MAP prepared by CT DEP, May 2011.
