CONTOUR MAP
Willington, CT (North)

EXPLANATION
Contour lines are used to denote elevation above sea level. This map includes 20 foot contour lines based on USGS
LiDAR data for the year 2000. This information is only suitable for general planning and is not intended for
exact determinations of elevation where a survey is normally required, or for detailed engineering,
building, or design purposes. The Connecticut LiDAR
data for 2000 captured ground elevation every 20 feet or
an editorial accuracy of approximately 3 feet on the ground.

For unknown reasons, data was collected unevenly in some
areas. This resulted in data gaps that affect the overall
understanding of these contour lines. With this information, a general
sense of the lay of the land can be ascertained. Gentle slopes
are characterized by widely spaced contour lines, while
sharp slopes are represented by closely spaced contour
lines. Contour lines that cross streams flowing through
canyons of noticeable relief will form a V-shaped deflection
with the apex of the V pointing upstream.

DATA SOURCES
BASE MAP DATA - All data is based on 1:24,000 scale USGS aerial photography, digital orthoimagery,
topographic, and transportation data. Base map data is
subject to errors and is incomplete.
STREET DATA - Based on TeleAtlas copyrighted data.
CONTOUR DATA - Derived from a statewide 10-
foot Digital Elevation Model (DEM) surface based
on the Connecticut 2000 LiDAR ground elevation
data. This information was transformed into contour lines
for this map and is only suitable for general planning
purposes.

Map prepared by CT DEP, May 2011.
