Contour lines are used to denote elevation above sea level. This map displays 20 foot contour lines based on a State Plane Coordinate System of 1983, Zone 3526 data. The University of Connecticut, Center for Geographic Information, developed the State Plane Coordinate System of 1983 elevation data. The University of Connecticut edited it to fill in data gaps with contour lines from USGS 1:24,000-scale topographic maps. Contour lines are used to denote elevation above sea level. This map displays 20 foot contour lines. Contour lines that cross streams flowing through valleys of noticeable relief will form a V-shaped deflection with the apex of the V pointing upstream.

For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall accuracy of the contour lines. Contour lines that cross streams flowing through valleys of noticeable relief will form a V-shaped deflection with the apex of the V pointing upstream.
