Contour lines are used to denote elevation above sea level. This map displays 10 foot contour lines based on the Connecticut LiDAR data for the year 2000. This information is only suitable for general planning and informational use. It is not intended for exact determinations of elevation where a survey is normally required, or for detailed engineering, building, or design purposes. The Connecticut LiDAR data for 2000 captured ground elevation every 10 feet at an absolute accuracy of approximately 3 feet on the ground.

For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall accuracy and appropriateness of derived data products such as flood prone areas. The DEM and edited it to fill in data gaps with interpolated elevation data.

STREET DATA - Based on TeleAtlas copyrighted data.

DATA SOURCES
- Basemap data derived from a statewide 10 foot Digital Elevation Model (DEM) surface based on the Connecticut 2000 LiDAR ground elevation data. This data was published in the Connecticut Land Use Atlas published in 2002 with data collected and edited at 1 foot in data gaps with information from contour lines on a USGS 1:24,000 scale topographic map.
