CONTOUR MAP
Sharon, CT
(Southeast)

EXPLANATION
Contour lines are used to denote elevation above sea level. This map shows 20 foot contour lines. Based on the Connecticut 1:24,000 Scale Topographic Maps and LiDAR data for the year 2000. This information is only suitable for general planning and informational purposes. Contour lines are used to denote elevation above sea level.

DATA SOURCES
BASE MAP DATA - All data is based on 1:24,000 scale topographic maps.
LiDAR data for the year 2000. This information is only suitable for general planning and informational purposes. Contour lines are used to denote elevation above sea level.

For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall accuracy and appropriate use of derived data products such as these contour lines. With this information, a general sense of the land can be constructed. Flat areas are characterized by widely spaced contour lines, while steep slopes are represented by closely spaced contour lines. Contour lines that consist of relatively level and flat areas will form a V-shaped deflection with the apex of the V pointing upstream.

a horizontal accuracy of approximately 3 feet on the ground.

suitable for general planning and informational purposes. It is not intended for exact determinations of elevations where a survey is normally required, or for structural engineering, building, or design purposes. The Connecticut LiDAR dataset for 2000 captured ground elevation every 20 feet with horizontal accuracy of approximately 3 feet on the ground.
