Contour lines are used to denote elevation above sea level. This map displays 20-foot contour lines based on a horizontal accuracy of approximately 3 feet on the ground. For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall map and made it difficult to ascertain the lay of the land. Gentle slopes are characterized by widely spaced contour lines, while steep slopes are represented by closely spaced contour lines. With this information, a general sense of the lay of the land can be ascertained. Gentle slopes are represented by closely spaced contour lines, while steep slopes are represented by closely spaced contour lines. Contour lines that cross streams flowing through hills will form a V-shaped deflection with the apex of the V pointing upstream. Data gaps affect the overall map, making it difficult to ascertain the lay of the land. For unknown reasons, data was collected unevenly in some areas. This resulted in data gaps that affect the overall map and made it difficult to ascertain the lay of the land.
