CONTOUR MAP
Southbury, CT (West)

EXPLANATION
Contour lines are used to denote elevation above sea level. This map displays 20 foot contour lines based on
2000 Connecticut LiDAR data for the year 2000. This information is only suitable for general planning and information purposes. It is not intended for exact determinations of elevation where accuracy is critically required, or for detailed engineering, building, or design purposes. The Connecticut LiDAR data for 2000 captured ground elevation over 20 feet at an
inherent accuracy of approximately 3 feet on the ground.

for submission reasons, data was collected anaerobically in some areas. This resulted in data gaps that affect the overall completeness of these contour lines. With this information, a general sense of the lay of the land can be maintained, while steep slopes are characterized by closely spaced contour lines, while gentle slopes are represented by widely spaced contour lines. Contour lines that cross streams flowing through valleys of noticeable relief will form a V-shaped deflection with the apex of the V pointing upstream.

DATA SOURCES
CONTOUR DATA - Derived from a statewide 10-
foot Digital Elevation Model (DEM) surface based
on the Connecticut 2000 LiDAR ground elevation data. The University of Connecticut Center for GIS provided the LiDAR and edited it to fill in data gaps with information from existing 1/2" scale topographic maps.
STREET DATA - Based on TeleAtlas copyrighted
data.

HILLS MAP (DEM): All data is based on a 1,000-foot
scale and includes geographic names, drawn and
determined to represent the best available data for
airports, and hydrography. Base map data is
overall omission completeness.
