DATA SOURCES

ORTHOPHOTOGRAPHY - Orthophotography is provided by the USGS and is based on 1990 3.75 Minute Digital Orthophoto Quarter Quadranles (DOQQs), which cover one quarter the area of a USGS 1:24,000 scale topographic map. The photographs were taken in the Spring of 1990 during leaf-off conditions and the ground resolution for the imagery is 3.28 feet (1 meter) per image pixel. This statewide orthophotography is not color balanced so some areas may be darker than others. Also, the location and shape of features in other GIS data may not exactly match information shown in the photos. Street-level data such as major interstates, US routes, state routes, streets, railroads, and ferry crossings are displayed. Due to changes in the location and names of streets, streets in the orthophoto may not match the street layer. Also shown are airports, hospitals, educational facilities, train stations, and town boundaries. Important geographic locations and waterbodies are labeled.

BASE MAP DATA - All data is based on 1:24,000 scale and displays geographic names, places and their symbols, town boundaries, railroads, and airports. Base map data is neither current nor complete. Street data is based on TeleAtlas copyrighted data.
