This map displays 2004 black and white orthophotography for the State of Connecticut. The photographs were taken in last light conditions and the ground resolution for the imagery is 0.8 feet per image pixel. Unlike other statewide aerial surveys, the 2004 mosaic is comprised mostly of 2004 photos, but photos taken during the spring of 2000 and 2001 were introduced to improve image quality. This is due to the amount of rain in the spring of 2004 experienced, making it difficult to survey and take conditions in these photos. The height and shapes of features in other USGS layers will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates. Street-level data such as major interstates, US routes, state routes, streets, railroads, and ferry crossings are displayed. Due to possible changes in street locations over time, locations of streets on the orthophotography may not match the locations of streets in the street layer. Also shown are airports, hospitals, educational facilities, rail stations, and area boundaries. Important geographic locations and waterbodies are labeled.

DATA SOURCES
ORTHOPHOTOGRAPHY: Funding for the statewide orthophotography was provided by the State of Connecticut (DOE), DOT, and DOT.
BASE MAP DATA: All data is based on 1:24,000 scale and displays geographic names, places, and their symbols, road boundaries, railroads, and airports. Base map data do not match exact or complex. Street data is based on Telavision orthophotography data.

MAPS AND DIGITAL DATA: Visit the CT DEP website for the map and a variety of other data.
