This map displays 2004 black and white orthophotography for the State of Connecticut. The photographs were taken in leaf-off condition, and the orthophotography is based on the imagery collected from a variety of locations during the spring of 2004. These images are not colorfast. This is due to the amount of rainfall the spring of 2004 experienced, making it difficult to arrive at ideal conditions to take photos. The location and shape of features on other GIS layers will not exactly match information shown in the orthophotography primarily due to differences in spatial accuracy and data collection dates. Street-level data such as major interstates, US routes, state routes, streets, railroads, and ferry crossings are displayed. Due to possible changes in street locations over time, locations of streets on the orthophotography may not match the locations of streets on the street layer. Also shown are airports, hospitals, educational facilities, town boundaries, and parks. The data is based on aerial survey data. This map is not colorfast.
