2005 Coastal Color Infrared Orthophoto Norwalk, CT (North)

EXPLANATION

This map displays 2005 color infrared orthophotography as a view of coastal Connecticut within 0.05 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River to the Massachusetts State line. Color infrared photography often called "false color" is useful for interpreting natural resources. The data was collected on six different dates between June 15th and September 15th, 2005, when the tidal stage was <= 1 foot of the predicted low tide. Since it was collected during the growing season, the data is captured as a "false color" orthophotography in which vegetation obscures some ground features. The 2005 orthophotography has a ground resolution of 1.04 ft (0.031 meter) per image pixel. Additional GIS data displayed includes various resources, U.S. routes, state routes, county, ferry crossings, airports, hospitals, educational facilities,eryl stations, and town boundaries. Important geographic locations and waterbodies are labeled. The locations and shape of features in the GIS layers may not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates.

DATA SOURCES

ORTHOPHOTOGRAPHY - Imagery compiled by James W. Sewall Co. and published by the DEP (Office of Land Use Planning).

BASE MAP DATA - All data is based on 1:24,000 scale and display geographic names, places and their related data are from standard Connecticut sources. Street data is outdated or incomplete. Street data is based on Fairfield County topography data.

IMAGERY AND DEDAL DATA - Visit the CT DEP website for this map and a variety of others to PDF format. Visit the CT DEP website to download the base map digital data shown on this map.
