2005 Coastal Color Infrared Orthophoto
Windsor, CT
(South)

EXPLANATION
This map displays 2005 color infrared orthophotography as a series of aerial overviews within 500 ft of the shoreline and regulated tidal
waterways, all offshore islands, and the Connecticut River to the
Massachusetts State line. Color infrared orthophotography, often called "false
color" is useful for interpreting natural resources. The data was collected
on six different dates between June 15th and September 15th, 2005, when
the tidal stage was +/- 1 hour of the predicted low tide. Since it was
collected during the growing season, the data is converted to "false-color"
orthoimagery to reflect vegetation and some ground features. The
2005 orthophotography has a ground resolution of 1 foot (0.3048 meters) per
image pixel. Additional GIS data displayed includes major waterbodies,
US streets, state routes, streams, ferry crossings, airports, hospitals,
educational facilities, town names, and town boundaries. Important geographic
locations and waterbodies are labeled. The location and shape of features
in the GIS layers may not exactly match information shown in the aerial
photography primarily due to differences in spatial accuracy and data
collection dates.

DATA SOURCES
ORTHOPHOTOGRAPHY - Imagery compiled by James W. Stoddard Co. and published by the DEP
Office of Land Use Planning.
BASE MAP DATA - All data is based on 1:24,000 scale and display geographic names, places and
city/town boundaries on the map. - Street data is based on TownBase. - streets are labeled.
BASE MAP DATA is based on TownBase copyrighted data.
SATELLITE AND DIGITAL DATA - Visit this CT DEP website for this map and a variety of others to
download. Visit the CT DEP website to download the base map digital spatial data shown on the
map.
