2005 Coastal Color Infrared Orthophoto Middletown, CT (Southwest)

EXPLANATION
This map displays 2005 color infrared orthophotography as an area of coastal Connecticut within 1,000 ft of the shoreline and regulated wild
land/dunes, all offshore islands, and the Connecticut River to the
Massachusetts State line. Color infrared photography, often called "false
color," is useful for interpreting natural resources. The data was collected on
six different dates between June 15th and September 15th, 2005, when
the tidal stage was ~1 hour of the predicted low tide. Since it was
collected during the growing season, the data is categorized as "false-color"
photography to enhance vegetation-dense ground features. The
2005 orthophotography has a ground resolution of 1 foot (0.3 meters)
per image pixel. Additional GIS data displayed includes major
features, railroads, state roads, state routes, ferry crossings, airports, hospitals, educational
facilities, towns stations, and town boundaries. Important geographic
locations and waterbodies are labeled. The location and shape of features
in the GIS layer may not exactly match information shown in the aerial
photography primarily due to differences in spatial accuracy and data
collection dates.

DATA SOURCES
ORTHOPHOTOGRAPHY: Imagery compiled by James W. Scavelli Co. and published by the DEP
Office of Long Island Programs.
BASE MAP DATA: All data is based on 1:24,000 scale and displays geographic names, places and
road locations, town boundaries, and airports. Base map data is not current or complete. Street
data is based on TeleAtlas copyrighted data.
MAPS AND DIGITAL DATA: Visit the CT DEP website for this map and a variety of others in
PDF format. Visit the CT DEP website to download the base map digital spatial data shown on this
map.

Map prepared by CT DEP. May 2005. Map is not colorfast. Protect from light and moisture.
