This map displays 2008 National Agriculture Imagery Program (NAIP) infrared orthophotography for the State of Connecticut. It is a color infrared, leaf on, 3.39 foot (1 meter) aerial survey taken on July 3rd, 1988, 1989, 1990, and 1991. This infrared orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting land use planning and monitoring of land use change. The infrared technology provides a disparity in the range and intensity of colors depending on the area viewed. The location and shape of features in other GIS layers will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and date collection dates. Where level data such as major waterbodies, U.S. routes, state routes, mines, railroads, and ferry crossings are displayed, but may not match the locations of each feature on the other GIS layers. Important geologic features, hospitals, educational facilities, town lines, and town boundaries. Important geologic features, locations and waterbodies are labeled.
