2010 Coastal Color Infrared Orthophoto
Darien, CT

EXPLANATION
This map displays 2010 color infrared orthophotography covering areas of coastal Connecticut within 300 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River to the Massachusetts State line. Color infrared photography, often called "false color," is useful for interpreting natural resources. The data was collected between June 23rd and 18th, 2010, when the sun was at midsummer. The data was collected during the growing season, so the data is considered as an orthophotography to which vegetation densities were general features. The 2010 orthophotography has a ground resolution of 1 foot (0.3 meter) per image pixel. Additional GIS data displayed include major interstates, US routes, state routes, streets, ferry crossings, airports, hospitals, educational facilities, town stations, and town boundaries. Important geographic boundaries and waterbodies are labeled. The location and shape of features on the GIS layers may not exactly match information shown on the aerial photography partly due to differences in spatial accuracy and data collection dates.

DATA SOURCES
ORTHOPHOTOGRAPHY: Imagery compiled by Planet/Imagery, Inc. and published by the DEP Office of Long Island Programs.
BASE MAP DATA: All data is based on 1:24,000 scale and displays geographic names, places and their symbols, town boundaries, and shorelines. Base map data is neither current nor complete. Vector data is based on Trumbull's orthophotograph.
MAPS AND DIGITAL DATA: Visit the DEP website for this map and a variety of others at DEP Connect. Visit the CT DEP website to download the base map digital orthophoto data on this map.
