This map displays 2010 color infrared orthophotography covering areas of eastern Connecticut within 1,800 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River to the Massachusetts state line. Color infrared photography, often called "false color," is useful for interpreting natural resources. The data was collected between June 13th and 18th, 2010, when the sun was at 70° elevation and 140° azimuth. The data was collected during the growing season. The data is classified as "baseline" orthophotography in which vegetation obscures some ground feature. The 2010 orthophotography has a ground resolution of 1 foot (0.3048 meters) per image pixel. Additional GIS data displayed include major interstates, US routes, state routes, streets, ferry crossings, airports, bridges, underground facilities, train stations, and term boundaries. Important geographic locations and waterbodies are labeled. The location and shape of features in the GIS layers may not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection date.

DATA SOURCES
ORTHOPHOTOGRAPHY - Imagery compiled by PlanetImages, Inc. and published by the DEP Office of Long Island Programs.
BASE MAP DATA - All data is based on USGS 1:24,000 scale and displays geographic names, places and their symbols, street boundaries, and topography. Base map data is in public domain and is available.
MAPS AND DIGITAL DATA - Visit the CTDEP website for this map and a variety of others in PDF format. Visit the DEP website to download the base map digital data shown on this map.
