This map displays 2010 color infrared orthophotography covering areas of coastal Connecticut within 1,800 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River to the Massachusetts State line. Color infrared photography, often called "false color," is useful for interpreting natural resources. The data was collected between June 20th and 26th, 2010, when the tidal stage was +/- 1 hour of the predicted low tide. Since it was often called "false color," is useful for interpreting natural resources. The location and shape of features in the GIS layers may not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates.
