The data was collected between June 15th and 19th, 2010, when the tree canopy was at peak density. Trees were selected randomly and images were collected during the growing season, the data is categorized as "leaf-on" orthophotography in which vegetation obscures some ground features. The 2010 orthophotography has a ground resolution of 1 foot (0.305 meter) per pixel. Additional GIS data displayed includes major interstates, US routes, state routes, rivers, ferry crossings, airports, hospitals, educational facilities, town stations, and town boundaries. Important geographic locations and vegetation are labeled. The location and shape of features in the GIS layer may not exactly match information shown in the aerial photography probably due to differences in spatial accuracy and data collection date.
