This map displays 2010 color infrared orthophotography covering areas of central Connecticut within 1,400 ft. of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River in the Massachusetts State line. Color infrared photography — often called "false color" — is useful for interpreting spectral information. The data was collected between June 29th and 30th, 2010. When the data was collected during the growing season, the data is represented as "green" on orthophotography to which vegetation absent was given priority. The 2010 orthophotography has a ground resolution of 1 foot (0.305 meter) per image pixel. Additional GIS data displayed include major interstates, US routes, state routes, rivers, ferry crossings, airports, hospitals, educational facilities, train stations, and town boundaries. Important geographic locations and landmarks are labeled. The location and shape of features in the GIS layer may not exactly match information shown in the aerial photography precisely due to differences in spatial accuracy and data collection dates.
