This map displays 2010 color infrared orthophotography covering areas of coastal Connecticut within 1,000 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River to the Massachusetts State line. Color infrared photography, often called "false color," is useful for interpreting natural resources.

The data was collected between June 15th and 18th, 2010, when the leaves of deciduous trees were about half their normal size. The data was collected during the growing season; the data is considered as "boosted" orthophotography in which vegetation absorbs more green energy. The 2010 orthophotography has a ground resolution of 1 foot (0.305 meter) per image pixel. Additional GIS data displayed include major interstate, US routes, state routes, streets, ferry crossings, airports,觉醒, educational facilities, parks, statutes, and town boundaries. Important geographic locations and waterbodies are labeled.

The location and shape of features in the GIS layers may not match exactly with those shown in the aerial photography probably due to differences in spatial accuracy and data collection date.

**DATA SOURCES**

ORTHOPHOTOGRAPHY: Imagery compiled by Planet/LiDAR, Inc. and published by the DEP Office of Energy Management.

BASE MAPS: All data is based on 1:24,000 scale digital topographic maps and other national and state datasets. Some map data is in vector format or digital data as polygonized data (imported from vector data).

MAPS AND DIGITAL DATA: Visit the DEP website for the map and a variety of other data. Visit the DEP website to download the base map digital tile data shown on this map.
