This map displays 2010 color infrared orthophotography covering areas of coastal Connecticut within 1,800 ft of the shoreline and regulated tidal wetlands, all offshore islands, and the Connecticut River in the Massachusetts State line. Color infrared photography, often called "false color," is useful for interpreting natural resources. The data was collected between June 12th and 18th, 2010, when the data was captured as "true color." Orthophotography is black vegetation shows some general feature. The 2010 orthophotography has a ground resolution of 1 foot (0.305 meter) per image pixel. Additional GDB data deployed include major interstates, US routes, state routes, streets, ferry crossings, airports, hospital, educational facilities, train stations, and town boundaries. Important geographic locations and waterbodies are included. The location and shape of features in the GIS layers may not exactly match information shown in the aerial photographs partly due to differences in spatial accuracy and data collection dates.

DATA SOURCES
ORTHOPHOTOGRAPHY - Imagery compiled by PlanetLabs, Inc. and published by the DEP Office of Geospatial Programs.
BASE MAP DATA - All data is based on 1:24,000 scale and displays geographic names, places and other symbols, users location, and symbols. Base map data is neither current nor complete. Vector data is based on TIGER/Line copyrighted data.
MAPS AND DIGITAL DATA - Visit the CT DEP website for this map and a variety of others in PDF format. Visit the CT DEP website to download the base map digital data from here on this map.
