Supporting identification and mapping of habitat areas. Also shown are locations of such features on the orthophotography. Also shown are major roads, railroads, and ferry crossings are displayed but may not match the locations of such features on the orthophotography. Also shown are hospitals, educational facilities, train stations, and more boundaries. Important geographic locations and waterbodies are labeled.

DATA SOURCES
ORTHOPHOTOGRAPHY - National Agriculture Imagery Program (NAIP) aerial orthophotography for the State of Connecticut. It is color infrared, leaf-on, 3.39 foot (1 meter) aerial survey taken during the Spring of 2010. This aerial orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting identification and mapping of habitat areas. The statewide orthophotography is an example of what is called true color infrared photography. This type of photography has a greater input images that are not corrected for differences in position and intensity of colors depending on the area viewed. The location and shape of features in other GIS layers will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates. Smaller-scale data such as major roads, railroads, and ferry crossings are displayed but may not match the locations of such features on the orthophotography. Also shown are hospitals, educational facilities, train stations, and more boundaries. Important geographic locations and waterbodies are labeled.

Map prepared by CT DEP, January 2011.
Map is not colorfast.
Protect from light and moisture.
Printed on non-colorfast paper.
