The location and shapes of features in other GIS layers will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates. Some features such as nature preserves, US routes, state routes, major railroads, and ferry crossings are displayed but may not match the exact location of each feature on the orthophotography. Also, some airports, hospitals, educational facilities, train stations, and town boundaries are labeled. Important geographic locations and waterbodies are labeled.

DATA SOURCES
ORTHOPHOTOGRAPHY: National Agriculture Imagery Program (NAIP) infrared orthophotography for the State of Connecticut. It is a color infrared, half scale, .539 foot (1 meter) aerial survey taken during the summer of 2012. This infrared orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting identification and mapping of habitation areas. The statewide infrared orthophotography imagery was then enhanced and mosaiced together to form a single zoom level product. The input images is not colorfast so differences are present in the range and intensity of colors depending on the area viewed. The location

EXPLANATION
This map displays 2012 National Agriculture Imagery Program (NAIP) infrared orthophotography for the State of Connecticut. It is a color infrared, half scale, .539 foot (1 meter) aerial survey taken during the summer of 2012. This infrared orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting identification and mapping of habitation areas. The statewide infrared orthophotography imagery was then enhanced and mosaiced together to form a single zoom level product. The input images is not colorfast so differences are present in the range and intensity of colors depending on the area viewed. The location
