This map displays 2012 high resolution infrared orthophotography for the State of Connecticut. It is a color infrared, leaf off, 1 foot (0.3 meter) aerial survey taken in the Spring of 2012. This infrared orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting development planning and emergency management activities. The location and range of services is out of DRIM will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates. Structures such as major interstates, US routes, state routes, streets, railroads, and ferry crossings are displayed but may not match the locations of each feature on the orthophotography. Also shown are airports, hospitals, important geographic locations and waterbodies are labeled.

DATA SOURCES
ORTHOPHOTOGRAPHY - Aerial imagery is provided through a partnership between Connecticut Department of Emergency Management and Public Safety, Connecticut Agricultural Experiment Station, and the Federal Geographic Data Committee. The imagery is provided by the U.S. Geological Survey (USGS) through a cooperative agreement between USGS and U.S. Division of the Air Force (USAF) to provide imagery support through project management, contract execution, and quality assurance/quality control (QA/QC).
BASE MAP DATA - Based on data originally from 1:24,000-scale USGS 7.5 minute topographic quadrangle maps published during the 1950s through 1970s. The map products were produced using digital versions of the quadrangles, aerial images, and current orthophotography. Features and place names were added using publicly available data products. These and other data all together create a reliable and useful information base for the State of Connecticut.
