This map displays 2012 high resolution infrared orthophotography for the State of Connecticut. It is a color infrared, leaf-off, 1 foot (30-meter) aerial survey taken in the Spring of 2012. This infrared orthophotography provides many services, such as observing crop and vegetation conditions as well as supporting identification and mapping of habitat areas.

The locations and shapes of features in other GIS layers supporting identification and mapping of habitat areas will not exactly match information shown in the aerial photography primarily due to differences in spatial accuracy and data collection dates. Structures such as major interstates, US routes, state routes, streets, railroad, and ferry crossings are displayed but may not match the locations of each feature on the orthophotography. Also shown are airports, hospitals, educational facilities, train stations, and town boundaries. Important geographic locations and landmarks are labeled.

DATA SOURCES
- ORTHOPHOTOGRAHY - Aerial imagery is provided through a partnership between Connecticut Department of Emergency Management and Homeland Security, USGS, the Connecticut Department of Transportation (CDOT), and the Department of Energy and Environmental Protection (DEEP) through the project "Connecticut Island Inlet Infrared Orthophotography for the State of Connecticut".
- BASE MAP DATA - Based on data originally from 1:24,000-scale USGS 7.5 minute topographic quadrangle maps published by the U.S. Geological Survey, revised and updated by DEEP through the project "Connecticut Island Infrared Orthophotography for the State of Connecticut".
