River Road Pond No 1
Scenario for morphosequence development in ice-dammed (Top) and sediment-dammed basins (Bottom). The mechanism of impoundment and the chronological and topographic meltwater deposits on the landscape were controlled by the topography of the area positions of the deposits are related to the orientation of the basins relative to the direction of ice retreat. These relationships are reflected in the organization and color coding of the List of Postglacial Deposits (dune deposits) which are most commonly concentrated in valleys and lowlands.

Floodplain Alluvium
Area of glaciofluvial deposits grading to glacial lake
