EARLY POSTGLACIAL DEPOSITS - early Holocene, late Wisconsinan

Processes that are still active (or are manmade), have been grouped together as Postglacial Deposits.

Particular attention has been paid to understanding the distribution and characteristics of well-to-poorly sorted sands, gravels, silts and clays with few to no boulders, and the lack of sorting and stratification typical of ice-laid deposits.

The Quaternary Geology information illustrates the geologic history and the effects are of pervasive importance to present-day occupants of the land.

BASE MAP DATA - Based on data originally from 1:24,000-scale USGS 7.5 minute maps, Connecticut Department of Environmental Protection. These data were digitized to a scale of 1:24,000 (1 inch = 2,000 feet) when map is printed at original size (48 x 36 in)
