Soil Drainage Class in the Wilton, Connecticut area is determined based on the ability of water to be removed from the soil. The map categorizes areas into five classes: well drained, moderately well drained, somewhat poorly drained, poorly drained, and very poorly drained. Each class is defined by the rate of water removal from the soil, with well-drained areas having the fastest removal rate and very poorly drained areas having the slowest.

**EXPLANATION**

The explanation section provides details on the map categories and how they are determined. It explains that the map color and label are used to indicate the soil drainage class, and that the map is designed to help identify areas where water management strategies may be needed.

**DATA SOURCES**

The data used to create the map includes various sources such as soil surveys, topographic maps, and hydrological data. The map was produced by U.S. Department of Agriculture, Natural Resources Conservation Service, and the data was collected and processed to create a digital dataset for the map.

This map does not represent current soil conditions, but rather a historical overview based on the data available at the time of its creation.
