The map shows the distribution of farmland soils in Beacon Falls, Connecticut. The soils are categorized into three types: Prime Farmland Soils, Important Farmland Soils, and Local Farmland Soils. Prime Farmland Soils are those soils that have the best conditions for growing crops and are located in areas that are suitable for agriculture. Important Farmland Soils are those soils that are less suitable for agriculture but still have some value, while Local Farmland Soils are the least valuable for agriculture.

The map uses various symbols to represent different types of soil and land use. These symbols include crop land, forest, wetlands, and developed areas. The map also includes a scale bar for reference.

The data sources for this map include aerial photography and land use data from the USDA-NRCS. The map was prepared by the USDA-NRCS in cooperation with the state of Connecticut.

EXPLANATION
This map shows the distribution of farmland soils in Beacon Falls, Connecticut. The soils are categorized into three types: Prime Farmland Soils, Important Farmland Soils, and Local Farmland Soils. Prime Farmland Soils are those soils that have the best conditions for growing crops and are located in areas that are suitable for agriculture.
