The soils were mapped at a scale of 1:12,000 with a minimum size. Soil Survey Geographic Database (SSURGO) database produced of those lands that have productive soils. Those lands may qualify statewide important farmland or locally important farmland based on their ability to produce high yields and the economically conduct high yields of field crops. This map identifies land that is defined as prime farmland, producing food, feed, forage, fiber, and oil seed crops, and those lands that are mapped at a scale of 1:24,000 when map is printed at original size (48 x 36 in).
