are those soils that have the "Prime Farmland Soils", which are defined as soils that have a high level of productivity and potential for producing high value crops. These soils are suitable for a wide range of farming methods.

Prime Farmland Soils are those soils that meet all of the requirements of prime farmland soils, including water management, according to acceptable farming practices. They are defined as soils that have a high level of productivity and potential for producing high value crops.

This map identifies land that is defined as prime farmland, including water management, according to acceptable farming practices. It includes locally important farmland soils, which are important to the local economy due to their production of high value food, fiber or horticultural crops.

As the minimum size delineation is approximately 3 acres, this map does not necessarily portray land that is used currently for the production of high value food, fiber or horticultural crops. This map may fail to meet one or more of the requirements of prime farmland soils, including water management, according to acceptable farming practices.

This map is intended to be printed at its original dimensions in order to maintain the 1:24,000 scale (1 inch = 2000 feet). This map does not necessarily portray land that is used currently for the production of high value food, fiber or horticultural crops.
