FARMLAND SOILS
SALISBURY, CONNECTICUT

LEGEND
Prime Farmland Soils are those soils that have the fewest limitations. These soils have high productivity and are suitable for prime farmland. These soils may have limitations such as slight erosion tendencies but are not impaired by adverse site characteristics such as steep slopes, wet areas, or shallow soils. However, soils in this category can be converted to non-agricultural uses and can still continue to provide high yields or crops when treated and managed, according to acceptable farming practices.

Important Farmland Soils are those soils that fail to meet one or more of the requirements of prime farmland, but are important for the production of high value food, fiber or horticultural crops. This includes those soils which are highly erodible and are managed according to acceptable farming practices.

Locally Important Farmland Soils are those soils which are only marginally adequate for the production of high value food, fiber or horticultural crops. This includes those soils which are highly erodible and are managed according to acceptable farming practices.

DATA SOURCES
Soil data was digitized from USGS 1:24,000 scale black and white soil surveys. The survey data was acquired and is located in the USGS National Technical Information Service (NTIS), 5285 Port Royal Rd., Springfield, VA 22161-2333. This map is intended to be printed at its original dimensions. To obtain a digital version of this map, please contact the Connecticut DEP Environmental Protection Division, at 860-424-4100 or visit the DEP website.

EXPLANATION
This map is intended to be printed at its original dimensions in scale 1:24,000 when map is printed at original size (48 x 36 in). This map shows important farmland or locally important farmland based on the soils data shown on this map. Visit the CT DEP website to map and a variety of others. Visit the NRCS soils website for the information is neither current nor complete.
