The soils were mapped at a scale of 1:12,000 with a minimum size of 500 square feet. The Soil Survey Geographic Database (SSURGO) database produced SOIL DATA - Soil map units shown on this map are from the 2007 national soil survey and are based on soil survey field work, modern data sources, and existing soil survey data. Additional information includes soil attributes such as depth, texture, and drainage. The map is useful for identifying potential areas for development and for planning purposes. Overall, the map provides a comprehensive view of the soil conditions in the area.
