HYDRIC SOILS
WINDSOR, CONNECTICUT

LEGEND

Hydric Soil — Those soils that occur under conditions of wetland, floodplain, or swampland vegetation. They are characterized by the presence of a嫌水层hydric layer that has an anaerobic condition due to waterlogged conditions. Under natural conditions, flooding or standing water is expected to continue at least 12 inches (30.5 cm) below the thawline. This condition may occur during the growing season in wetlands and floodplains, and during ice melting in swamplands.

Notes:

A combination of the hydric soil, hydrophytic vegetation, and soil map units are used to determine the hydric status. The presence of the hydric soil and hydrophytic vegetation are considered adequate to determine the hydric status, and specific hydric soils criteria are used to confirm the hydric status.
