The soil depth to bedrock ranges from 0 to 40 inches. Glaciofluvial material has been transported by moving water from melting ice. The material is usually rounded, well sorted sands and gravels. It has very high air and water movement, producing a compact or dense layer which reduces the flow of air and water movement, producing a very dry soil layer. The depth to bedrock ranges from 20 to 40 inches.

Related information

USGS 7.5 minute topographic quadrangle maps published between 1924 and 1970. These maps show the soil depth to bedrock, the thickness of glaciofluvial material, and the presence of rock outcrops. Visit the CT DEP website to view these maps.
