POTENTIAL FOR SUBSURFACE SEWAGE DISPOSAL
BLOOMFIELD, CONNECTICUT

LEGEND

High Potential: These soils have one or more limitations that can be easily overcome using conventional engineering practices

Medium Potential: These soils have significant limitations, such as low-permeability soils, that may require special design and construction techniques

Low Potential: These soils have minor limitations, such as low generations, and can be designed for subsurface sewage disposal

Exceptional: These soils have no limitations and are ideal for subsurface sewage disposal

EXPLANATION

This potential map may be used to determine the suitability of any given location for subsurface sewage disposal systems. The map provides a visual representation of the potential for subsurface sewage disposal based on soil characteristics. The map is intended to be used in conjunction with local regulatory requirements and is subject to change. The map should be interpreted in conjunction with local soil survey data and soil testing.

HOW TO USE THIS MAP

While this map provides valuable information, it is not intended to be a substitute for professional advice. The user should consult local soil survey data and soil testing agencies for specific site conditions. The map is provided as a general reference and is not intended for legal use.

DATA SOURCES

The data used to create this map includes information from the U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS) and other federal, state, and local agencies. This information is subject to change and the user should consult the latest data sources for the most accurate information.
