POTENTIAL FOR SUBSURFACE SEWAGE DISPOSAL
GRANBY, CONNECTICUT

LEGEND

High Potential: These soils have few if any limitations that can be easily overcome using conventional design practices.

Moderate Potential: These soils have significant limitations that can be overcome using conventional design practices.

Low Potential: These soils have few if any limitations that can be easily overcome using conventional design practices.

Very Low Potential: These soils have significant limitations that can be overcome using conventional design practices.

Note: These ratings are intended for use in determining the necessity for further investigation. They are not to be used as a basis for determining design requirements, nor to be used as a basis for determining the acceptability of design alternatives.

EXPLANATION

This soil potential map may be used to identify areas that are generally suitable for subsurface sewage disposal systems. It is not practical to design or install subsurface sewage disposal systems in areas identified as "Not Suitable." The "Suitable" category includes areas that may be suitable for a given system under the specific conditions of the design and installation.

HOW TO USE THIS MAP

This soil potential map was developed to aid in the identification of areas that may be suitable for subsurface sewage disposal systems. The map is intended to be used in conjunction with other available information to determine the feasibility of a subsurface sewage disposal system in a specific location.

DATA SOURCES

The data used to develop this map were obtained from a variety of sources, including soil surveys, land use planning, and other environmental studies. The map was developed by the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS), and is based on the best available information as of the date of publication.

This soil potential map is intended to be used as a general guideline and is not to be used as a basis for determining the suitability of a specific location for subsurface sewage disposal systems. Final decisions regarding the suitability of a location for subsurface sewage disposal systems should be made based on a thorough assessment of all available information, including local soil and water conditions, land use planning, and other environmental considerations.

The map is not to be used as a basis for determining the acceptability of design alternatives. It is intended to be used in conjunction with other available information to determine the feasibility of a subsurface sewage disposal system in a specific location.

Visit the NRCS website (www.nrcs.gov) for more information on subsurface sewage disposal systems and the design and installation of systems in specific locations.

The map is provided "as is" and is not to be used as a basis for determining the suitability of a specific location for subsurface sewage disposal systems. Final decisions regarding the suitability of a location for subsurface sewage disposal systems should be made based on a thorough assessment of all available information, including local soil and water conditions, land use planning, and other environmental considerations.
