These soils have to overcome misunderstanding of the detail of mapping. For the most recent Soil Survey Geographic Database (SSURGO) database produced, soils can be improved sufficiently to meet state regulations.

Soils meet the minimal requirements outlined in the regulations, such as low percolation rate and depth to seasonal high water table, that require extensive design and site preparation. A seasonal high water table, requiring extensive design and site preparation, is a factor in discounting this map for mapping purposes. The potential for subsurface disposal is not a public policy and not to be applied in a specific manner.

HOW TO USE THIS MAP

This soil potential map may be used as a guide for permit decisions as well as a guide for mapping. The map is not intended for use in regulatory decisions, nor for use in permit decisions. This map is intended for use in adjusting design and site preparation requirements.

DATA SOURCES

This soil potential map may be used as a guide for permit decisions as well as a guide for mapping. The map is not intended for use in regulatory decisions, nor for use in permit decisions. This map is intended for use in adjusting design and site preparation requirements.

The map is not colorfast. The map is not colorfast. The map is not colorfast.
