While this map shows the rating potentials for SSDS, to understand soil for a particular use compared to other soils in a given area, it is important to consider the state health code. It is unlikely that these regulations require extensive design and site preparation. A Very Low Potential might suggest a limitation, such as low percolation rate and depth to groundwater control system. Very Low and Low Potential soils might be the most restrictive in terms of design and construction. For more information, contact your local extension agent or visit the state agricultural extension service.
