**EXPLANATION**

This soil potential map may be used as a guide for planning and site selection for subsurface sewage disposal systems. The map is intended to show general areas that may be suitable for septic systems. The potential for subsurface sewage disposal is determined by the combination of soil characteristics and factors such as soil depth, permeability, and soil profile. The map is based on soil surveys and other available data, and it may not reflect all factors that affect the suitability of a site for a septic system.

**HOW TO USE THIS MAP**

While this map gives the general potential for SSDS, it is important to consider other factors, such as soil texture, depth to bedrock, and local regulations, when planning a subsurface sewage disposal system. The map should be used in conjunction with local building codes and regulations.

**DATA SOURCES**

This map was created by NRCS (Natural Resource Conservation Service) and is based on soil surveys and other data. The map was prepared by the Connecticut NRCS district office.

The map is intended to provide a general guide for planning and site selection for subsurface sewage disposal systems. It should be used in conjunction with other data and local regulations. The map does not reflect all factors that affect the suitability of a site for a septic system.
