CONNECTICUT INLAND WETLAND SOILS
NEW CANAAN, CONNECTICUT

LEGEND

- Poorly Drained and Very Poorly Drained soils are shaded on the map, and the pattern and intensity of shading is determined by the depth and extent of the water table. These soils are considered to be poorly drained and are generally found in areas with impeded drainage that are subject to periodic flooding. The minimum size delineation is approximately 3 acres. This map does not indicate the locations of regulated tidal areas, upland review areas, nor all permanent or intermittent water bodies.

- Open Plains, River, and Shoreline soil complexes are also shaded on the map to show their distribution. These soils are generally found in areas with few impeding features and are generally well-drained.

- Statistics, maps, and descriptions are available from the Connecticut Inland Wetland Soils Program.

EXPLANATION

The map is a representation of wetland soils in the New Canaan region of Connecticut. The soils are shaded to indicate their type and extent, with darker shading indicating more poorly drained soils. The map is intended to assist in the identification and management of wetland soils for conservation purposes.

DATA SOURCES

Connecticut Inland Wetland Soils Program

The map is based on data collected and analyzed by the Connecticut Inland Wetland Soils Program. The data was compiled and mapped by the Connecticut Department of Energy and Environmental Protection.

The map is a valuable tool for understanding the distribution of wetland soils in the New Canaan region. It can be used by planners, developers, and conservationists to identify areas that require protection and to develop strategies for their preservation.

The map is designed to be a guide for understanding the distribution of wetland soils in the New Canaan region. It is intended to be used in conjunction with other resources and tools to ensure the accurate identification and management of wetland soils.
