The map was prepared as part of the Connecticut Inland Wetland Soils Study, a project funded by the U.S. Department of Agriculture’s National Resources Conservation Service (NRCS) in collaboration with the University of Connecticut and the State of Connecticut Department of Agriculture. The study was designed to identify and map wetland soils in Connecticut, with the goal of providing information for land use planning and conservation efforts.

**Legend**
- **Carcass (Brown)**: Soils that are excessively drained to very poorly drained.
- **Shrub and Evergreen (Aqua) Aces**: Soils that are excessively drained to very poorly drained.

**Explanations**
- This map was prepared using a combination of historical and contemporary data sources, including aerial photography, soil survey maps, and field observations. The map includes a variety of wetland soil types, including those that are excessively drained to very poorly drained.
- The map does not indicate the locations of regulated tidal areas, and the delineation of three acres. Enlargement of this map beyond the wetland map units. Conversely, there may be Non-Wetlands as Section 22a-38. Wetland soils include "any of the soil types excessively drained to very poorly drained."
