Final mapping is based on extensive, site-specific, the area contributing ground water to the well field. Delineation is by the individual water companies owning areas is one of the requirements of Connecticut’s regulated Aquifer Protection Areas on a map. This information does not include protection areas for public water companies. The information above shows a hypothetical groundwater cleanup, and ground-water flow modeling, and then by the individual companies owning areas. Once mapped, a detailed final mapping. The aquifer protection area is strictly monitored and regulated. A water company must map the protection area is based on extensive, site-specific, detailed modeling of the ground water flow system at the well field. Mapping is in December 2014. More information about wellhead state.

The Aquifer Protection Program was established by the Department of Energy & Environmental Protection in 1984 to protect the quality of ground water and surface water in the state. The program is intended to prevent or mitigate pollution and other detrimental activities to ensure a quality, sustainable, and productive public water supply. This information does not include protection areas for public water companies. The information above shows a hypothetical groundwater cleanup, and ground-water flow modeling, and then by the individual companies owning areas. Once mapped, a detailed final mapping. The aquifer protection area is strictly monitored and regulated.
