This map shows the boundaries and subbasins of natural drainage basins in Connecticut. Drainage basins are delineated by contour lines and hydrography, which are used to determine the shape of the land surface depicted by the contour lines shown on this map.

To maintain the 1:24,000 scale (1 inch = 2000 feet), this map is intended to be printed at its original dimensions. This map is based on the statewide 10-foot DEM surface, which was derived from a statewide 1:125,000-scale 7.5 minute topographic quadrangle maps prepared by the U.S. Geological Survey.

A 7-digit drainage basin number such as 4302-02 uniquely identifies a basin. The first two digits (column 1) identify the major basin, the next two digits (column 2) identify the regional basin, and the last three digits (column 3) identify the subbasin. This map is intended to be printed at its original size (48 x 36 in).
