The map shows the natural and artificial drainage basins in the region of Hebron, Connecticut. The natural basins are characterized by widely spaced contour lines, while steep slopes are indicated by closely spaced contour lines. The map includes representations of major, regional, subregional, and local drainage basins. It is intended to serve as a municipal guide for drainage basin delineation and the identification of local basins within larger subregional, regional, and national boundaries. Arrows on the map indicate the direction of drainage, with arrows pointing downstream. The map is based on a DEM surface and is scaled at 1:24,000 (1 inch = 2000 feet) when printed at the original size (48 x 36 inches). The data gaps in the map are due to the unevenness of the Digital Elevation Model, which resulted in data losses in some areas. To identify either all upstream basins draining to or all downstream basins from a chosen basin, the map can be used.
