The map shows the natural drainage basins within the state of Connecticut. These basins are delineated using various symbols to indicate the direction and flow of water. The basins are classified into major, regional, and subregional categories based on their size and importance.

EXPLANATION

DATA SOURCES

NOTES: The natural drainage basins on this map were created using a combination of data sources, including aerial photographs, topographic maps, and field observations. The map was produced by the Connecticut Agricultural Experiment Station (CAES) in cooperation with the Connecticut Department of Environmental Protection (DEEP) and the U.S. Geological Survey (USGS).

Rivers, streams, and brooks on this map have been digitized from a statewide 7.5-minute topographic quadrangle maps published between 1943 and 1990. The LiDAR data for the year 2000 were collected by the Connecticut Department of Transportation and were used to generate the elevation data shown on this map.
