The map shows the natural and artificial waterways of the state of Connecticut. It includes major, regional, and local basins, as well as flood control areas. The map is useful for understanding the drainage patterns and flood risk areas. The data sources include contour lines from USGS 1:24,000-scale topographic maps, and the LiDAR elevation data collection of the year 2000. This information is suitable for general planning and informational purposes. The map includes the natural boundaries of the state, as well as the artificial boundaries created for flood control, building, or design purposes. With this information, a general sense of the drainage basin boundaries can be achieved.
