This page shows the major, regional, subregional and local water drainage basins in the state of Connecticut. The map was created by the University of Connecticut and the U.S. Geological Survey (USGS) between 1969 and 1984. The map is designed to show the natural drainage basins in the state and includes delineations of the 10-foot contour lines and hydrography. Drainage basin boundaries shown on this map were manually delineated by interpreting the 10-foot contour lines and hydrography.

The drainage basins were identified and numbered sequentially beginning upstream and proceeding downstream. Coastal direction is shown in blue and stem direction is shown in red. Local basins make up larger subregional, regional, and state basins. The map is at a scale of 1:24,000 (1 inch = 2000 feet) when printed at original size (48 x 36 in).

DATA SOURCES

The data for this map were obtained from the U.S. Geological Survey (USGS) and the University of Connecticut. The elevation data was obtained from the USGS between 1969 and 1984. The topographic mapping was updated using the 1985-1987 U.S. Geological Survey's National Elevation Data (NED) project, which included an improved topographic mapping of the state of Connecticut.

The drainage basins are numbered sequentially beginning upstream and proceeding downstream. Coastal direction is shown in blue and stem direction is shown in red. Local basins make up larger subregional, regional, and state basins. The map is at a scale of 1:24,000 (1 inch = 2000 feet) when printed at original size (48 x 36 in).
